

## Monster Makers Mask Paint

Mask Paint is a highly pigmented elastomer designed for maximum coverage and adhesion on latex masks and props. The individual paint colors may be intermixed to create a full range of custom colors. Some separation may occur during shipping or shelf time, so always shake well prior to use. Mask Paint can be applied several ways by hand, such as with a brush or stippling layers with a sponge.

The most effective way to apply the paint is with an airbrush. It is highly recommended to use an “external mix” airbrush such as the Paasche H or Badger 350 for paint application. These airbrushes mix the air and paint at the tip, outside the body of the brush, making for easier cleaning and maintenance. This is advantageous because the Mask Paint is a rather thick medium, making it difficult to maintain consistent flow in an internal mix brush. It is suggested to spray the paint **60-80 psi** for base-coating and **40-60 psi** for detailing.

Mask Paint can thicken over time, so it may be necessary to thin it down some. Water can be used as a thinning agent, but be careful not to use too much water as it may become too watery and possibly lose its elastic and adhesive properties. A few drops per ounce should be sufficient, and the paint may occasionally settle and need straining. To clean the paint from the brush, simply spray clean water through it, or pull dried paint out of spray cups. This is particularly important between color changes.

**Please Note:** The Mask Paint dries rather quickly and between 1/2 and a full shade darker than it appears in the bottle. Although the paint is relatively non-toxic, *always wear a dust mask or respirator with this or any airbrushed medium.*

SHAKE WELL BEFORE USE
